Survey Information

1,003 U.S. adults were surveyed via an online web-panel using Prodege MR, an industry leading market research provider. The survey was fielded from January 9th through 12th, and the results are reported with a 95% confidence level and a margin of error of +/- 3.

Survey respondents were selected via a stratified, quota sampling approach in order to ensure a representative sample of Americans. Balanced quotas for gender, age, race, ethnicity, and education were determined based on the U.S. Census Bureau's 2019 *American Community Survey* (ACS). The quotas were also stratified by census region to ensure geographical representativeness: [Northeast – 17.2%; Midwest – 21.0%; South – 37.3%; West – 24.5%]. Table A1 below summarizes the survey sample in comparison to the 2019 ACS.
